Outside Air Temperature (OAT) Sensor Circuit Performance (OAT wired to ECM)	P0071	Detects an Outside Air Temperature (OAT) sensor that is stuck in range. There are two components to the test: an engine off component, and an engine running component. If the engine has been off for a long enough period of time, and the coolant temperature and Intake Air Temperature (IAT) values are similar, then the air temperature values in the engine compartment of the vehicle are considered to have equalized. In this case, the engine off component of the diagnostic can be enabled. If the IAT and the OAT values are similar, then the OAT Performance Diagnostic passes. If the IAT and OAT values are not similar, the diagnostic will continue to monitor the IAT and the OAT as the vehicle starts to move. Outside Air Temperature (OAT) Sensor Intermittent In-Range	P0074	Detects a noisy or erratic signal in the Outside Air Temperature (OAT) circuit by monitoring the OAT sensor and failing the diagnostic when the OAT signal has a noisier output than is expected. When the value of the OAT signal in °C is determined, a delta is calculated between the current reading and the previous reading. The absolute value of these deltas is summed over a number of OAT readings. The result of this summation is called a “string length”. Since the OAT signal is anticipated to be relatively smooth, a string length of a particular magnitude indicates a noisy or erratic OAT signal. The diagnostic will fail if the string length is too high. Intake Air Temperature Sensor 3 Intermittent In-Range	P00EC	Detects a noisy or erratic signal in the Intake Air Temperature 3 (IAT3) circuit by monitoring the IAT3 sensor and failing the diagnostic when the IAT3 signal has a noisier output than is expected. When the value of the IAT3 signal in °C is determined, a delta is calculated between the current reading and the previous reading. The absolute value of these deltas is summed over a number of IAT3 readings. The result of this summation is called a “string length”. Since the IAT3 signal is anticipated to be relatively smooth, a string length of a particular magnitude indicates a noisy or erratic IAT3 signal. The diagnostic will fail if the string length is too high.	String Length Where: "String Length" = sum of "Diff" calculated over And where: "Diff" = ABS(current IAT 3 reading - IAT 3 reading from 100 milliseconds previous)	> 100.00 deg C 10 consecutive IAT 3 readings	Continuous		4 failures out of 5 samples Each sample takes 1.0 seconds	Type B, 2 Trips

Humidity Sensor Circuit Low	P00F4	Detects a continuous short to ground in the humidity signal circuit or a humidity sensor that is outputting a duty cycle that is too low. The diagnostic monitors the humidity sensor duty cycle output and fails the diagnostic when the humidity duty cycle is too low. The humidity sensor converts the capacitance across the sensor to a relative humidity. The relative humidity value is converted by the sensor to a duty cycle value in %. A digital square wave signal is transmitted by the sensor to the ECM. The ECM calculates the duty cycle of the square wave signal and converts that duty cycle to a relative humidity value in % through a transfer function. Manifold Absolute Pressure (MAP) Sensor Performance (US Market - 3 pressure sensor configuration)	P0106	This monitor is used to identify MAP sensor internal faults (measurement with an offset or a drift). Turbocharger/ Supercharger "A" Overboost Condition	P0234	This monitor detects failures in the charging air system such to not fulfill the request of boost pressure in the intake manifold. It works only in steady state closed loop pressure control zone. The DTC checks a permanent negative control deviation of the boost pressure indicating an overboost condition. This monitor is used to detect any malfunction in the boost pressure system causing the vehicle's emissions to exceed the limits. The aim of the overboost pressure monitor is to detect obstructions in the exhaust pipe. The boost pressure is usually controlled by the VGT vanes. The intake manifold pressure is also affected by the throttle valve and the HP EGR valve position changes. The aim of this procedure is to identify a limitation of the VGT vanes (equal to an obstruction) that leads to exceed the emission limits.	Boost pressure tracking error(difference between the desired boost pressure and the measured pressure at intake manifold by MAP sensor) lower than a threshold. If throttle control is active: The setpoint used for closed loop control is the conversion of the desired upstream throttle boost pressure (target) in desired intake boost pressure. The conversion of the setpoint is done calculating the pressure drop over the throttle valve that is strictly dependent on the valve position. If throttle control is NOT active: The setpoint used for closed loop control is the intake manifold pressure: in this situation the diagnostic monitors the boost pressure closed loop control tracking error. Turbocharger/ Supercharger "A" Underboost Condition	P0299	This monitor detects failures in the charging air system such to not fulfill the request of boost pressure in the intake manifold. It works only in steady state closed loop pressure control zone. The DTC checks a permanent positive control deviation of the boost pressure indicating an underboost condition. This monitor is used to detect any malfunction in the boost pressure system causing the vehicle's emissions to exceed the limits. The aim of the underboost pressure monitor is to detect leakages in the pipe after the compressor or in the intake/exhaust manifold. The boost pressure is usually controlled by the VGT vanes. The intake manifold pressure is also affected by the throttle valve and the HP EGR valve position changes. The aim of this procedure is to identify a limitation of the VGT vanes (equal to a leakage) that leads to exceed the emission	Boost pressure tracking error(difference between the desired boost pressure and the measured pressure at intake manifold by MAP sensor) higher than a threshold. Random Misfire Detected Cylinder 1 Misfire Detected Cylinder 2 Misfire Detected Cylinder 3 Misfire Detected Cylinder 4 Misfire Detected	P0300 P0301 P0302 P0303 P0304	These DTC's will determine if a random or a cylinder specific misfire is occurring by monitoring various terms derived from crankshaft velocity. The rate of misfire over an interval is compared to both emissions and catalyst damaging thresholds. The pattern of crankshaft acceleration after the misfire is checked to differentiate between real misfire and other sources of crank shaft noise.	Crankshaft Deceleration Value(s) vs. Engine Speed and Engine load The equation used to calculate deceleration value is tailored to specific vehicle operating conditions. The selection of the equation used is based on the 1st single cylinder continuous misfire threshold tables encountered that are not max of range. Crankshaft Position System Variation Not Learned	P0315	This DTC determines if the crankshaft sensor learn values that are stored in memory are valid. The angle between each tooth of the reluctor wheel is learned, and the sum of all angles together should sum to 360° (one revolution of the reluctor wheel). Default values, or corrupted values will not sum to 360°.	The Crankshaft target wheel should be 360 degrees around in circumferance. Loss or controller non-volitile memory or an error in memory will cause the values of individual teeth learn to be defaulted or incorrect. Exhaust Gas Recirculation (EGR) Flow insufficient	P0401	This monitor detects failures in the air system such to not fulfill the request of mass air flow through the intake circuit. This monitor is used to detect any malfunction in the air system that leads to lower EGR rate causing the vehicle's emissions to exceed the OBD limits. The aim of the EGR flow monitor is to detect HP EGR obstructions (insufficient EGR flow). The EGR flow depends on several variables like the HP EGR valve position, intake manifold pressure, exhaust pressure, EGR cooler outlet temperature. The aim of this procedure is to identify a limitation of the HP EGR (equal to an obstruction) that leads to exceed the OBD limits. Warm Up Catalyst Efficiency Below Threshold Bank 1 (OBD2, Cold start based monitor)	P0421	Cold start based monitor: the Catalyst (CC DOC) monitor only runs at cold start when dedicated conditions to detect this situation are satisfied. The diagnostic takes advantage of the HydroCarbon stored in the cold phase (the proper combination of combustion mode and injection pattern is requested in order to accumulate the proper amount of HC for performing a robust monitoring) and evaluates the energy produced by Catalyst during the following oxidation process (once that light-off temperature is fulfilled). The so calculated released energy is compared to the energy provided at CC DOC inlet in order to rescale the efficiency index value. Some corrections to minimize the results dispersion are finally applied. Two Stage Oil Pump Control Circuit Performance - Two Sided	P06DD	Diagnoses the two stage oil pump is stuck in the high pressure state. This diagnostic includes an intrusive test and a passive test. Intrusive test: The oil pump control is cycled off (high pressure) and on (low pressure) Y = 15 times at calibratable intervals. If a change in oil pressure above a calibration is not detected then the oil pressure is checked to determine if it is stuck. It takes X-out-of-Y failures to fail and set the appropriate code. Passive test: After the intrusive test passes, then a passive test will begin to run. The passive test will monitor the oil pressure changes associated with oil pump control state changes. If the passive test determines that the oil pressure change was less then desired then the intrusive test is retriggered. Fuel Pump Phase U-V-W Circuit Shorted	P102C	The fuel pump 3phase bridge driver [FTZM embedded] is capable of phase-to-phase circuit fault detection during the intrusive diagnostic phase (MOSFETs off, pump stopped and intrusive diagnostic test executed). The bridge driver is polled by the microcontroller once after successful completion of the intrusive diagnostic. The intrusive diagnostic is re-executed if the circuit fault is not removed and the pump initialization fails its motor alignment phase (an indication of a permanent fault). Fuel Pump Driver Control Module Fuel Pump Speed Signal Incorrect	P129F	FTZM ERFS control samples back-Electromotive Force [EMF] for zero voltage-level crossings as a detection method to enable closed loop control brushless commutation. Back EMF is an electrical characteristic of the inactive phase of the 3-phase signal wherein only 2 phases are active at any moment. Brushless pump speed is inferred using rate of zero-crossings detection and number of motor pole-pairs. Speed is reported to the ECM as serial data every 10 millisecs. Diagnostic software [FABR ring] calculates the error between the commanded, arbitrated fuel pump speed [FCBR ring] and the FTZM sensed fuel pump speed. The error is filtered and evaluated against calibratable threshold limits to determine pass/fail status. Any failure that exists on the fuel pump output circuit (3 phases) will be manifested in a Fuel Pump Speed	Sensed Filtered Fuel Pump Speed Error	> Speed Error Low Threshold [Supporting Table] **P129F Threshold Low** OR < Speed Error High Threshold [Supporting Table] **P129F Threshold High**	a) Diagnostic Enabled FABR Speed Rationality Diagnostic b) CAN Sensor Bus message $0CB_Available c) FABR Fuel Control Enable Fault Active d) Fuel Pmp Speed Command Alive Rolling Count and Checksum Error [CAN Bus B $0CE] [CFMR_b_FTZM_Cmd1_ARC_ChkErr] e) FABR Fuel Pump Ckt FA f) FABR Driver OverTemp FA g) Run_Crank input Voltage h) Sensor Bus Relay On j) CAN Sensor Bus message $0CB Data Fault [CFMR_b_FTZM_Info8_ARC_ChkErr] k) CAN Sensor Bus message $0CB Comm Fault [CFMR_b_FTZM_Info8_UcodeCmFA] l) Fuel Pmp Spd Command ARC and Checksum Comm Fault Code [CFMR_b_FTZM_Cmd1_UcodeCmFA] m) Timer - FABR Rising Edge Diagnostic Delay n) Timer - FABR Falling Edge Diagn Delay	a) == TRUE b) == TRUE c) <> TRUE d) <> TRUE e) <> TRUE f) <> TRUE g) > 11.00 volts h) == TRUE j) <> TRUE k) <> TRUE l) <> TRUE m) > 1.00 seconds n) > 1.00 seconds	1 sample / 12.5 msec	Type B, 2 Trips

Fuel Pump Driver Control Module Enable Circuit Performance	P12A6	The purpose of the Fuel Pump Driver Control Module Enable Circuit Performance diagnostic is to detect if the state of the fuel control enable circuit is valid. This is done by comparing the fuel control enable circuit state [high or low] sensed by the Fuel Tank Zone Module device to the commanded state of the fuel control enable signal from the ECM [in serial data]. When the sensed state does not match the commanded state, the fail counter increments. Fuel Pump Control Status Signal Message Counter Incorrect [FPPM applications only]	P12A8	To detect if the control status message transmitted as serial data from the driver control module is valid. The "rolling count check" value is created by adding an appended hexadecimal calculation to each control command value. The corresponding "check" value is transmitted to the FPPM as well as the actual command. At the FPPM, the received command value is used to create an expected "rolling count" value using the same calculation method as the ECM. The expected "rolling count" value calculated at the receiving power module (smart device) is compared to the transmitted "rolling count" value. If these do not match, a fault condition is reported forward to the ECM where X/Y diagnostic counting is performed. Barometric Pressure (BARO) Sensor Circuit Intermittent	P2230	Detects a noisy or erratic signal in the barometric pressure (BARO) circuit by monitoring the BARO sensor and failing the diagnostic when the BARO signal has a noisier output than is expected. When the value of BARO in kilopascals (kPa) is determined, a delta is calculated between the current reading and the previous reading. The absolute value of these deltas is summed over a number of BARO readings. The result of this summation is called a “string length”. Since the BARO signal is anticipated to be relatively smooth, a string length of a particular magnitude indicates a noisy or erratic BARO signal. The diagnostic will fail if the string length is too high. Turbocharger/ Supercharger Boost System A Performance (OBDII market only)	P2263	This monitor is used to detect any malfunction in the boost pressure control system causing very high or low intake manifold pressure that could lead to overspeed the turbine. It works only in steady state closed loop pressure control zone, tipically in the turbine overspeed area outside of the FTP test cycle. The DTC checks a positive or negative control deviation of the boost pressure indicating an underboost or overboost condition. The aim of the boost pressure system performance monitor is to detect leakages in the pipe after the compressor or in the intake/exhaust manifold (underboost) or obstructions in the exhaust pipe (overboost) that lead to overspeed the turbine.	Boost pressure tracking error: difference between the desired boost pressure and the measured pressure at intake manifold by MAP sensor. If throttle control is active: The setpoint used for closed loop control is the conversion of the desired upstream throttle boost pressure (target) in desired intake boost pressure. The conversion of the setpoint is done calculating the pressure drop over the throttle valve that is strictly dependent on the valve position. If throttle control is NOT active: The setpoint used for closed loop control is the intake manifold pressure: in this situation the diagnostic monitors the boost pressure closed loop control tracking error. Control Module Power Off Timer Performance	P262B	This DTC determines if the hardware timer does not initialize or count properly. There are two tests to ensure proper functioning of the timer: Count Up Test (CUT) and Range Test (RaTe). Count Up Test (CUT): Verifies that the HWIO timer is counting up with the proper increment. Range Test (RaTe): When the run/crank is not active both the hardware and mirror timers are started. The timers are compared when module shutdown is initiated or run/crank becomes active.	Count Up Test: Time difference between the current read and the previous read of the timer Range Test: The variation of the HWIO timer and mirror timer is	> 1.50 seconds > 0.25 %.			Count Up Test: 4 failures out of 20 samples 1 sec / sample Continuous while run/crank is not active and until controller shutdown is initiated. Range Test: Once per trip when controller shutdown is initiated or run/ crank becomes active.	Type B, 2 Trips

Clutch Pedal Position Sensor Circuit Range / Performance	P08A8	A Clutch Pedal position sensor range fault is detected, if Clutch Pedal Position Sensor is in a range indicative of a vehicle NOT in gear, when the vehicle is determined to be in gear. Gear determination is made by verifying that the ratio of engine RPM versus Transmission Output Speed (N/TOS) represents a valid gear. When this occurs a clutch pedal position error is measured and processed by a 1st order lag filter. When this clutch pedal position error exceeds the defined threshold, a this fault code is set. Fuel Pump Driver Control Module Signal Message Counter Incorrect [FPPM applications only]	P129E	To detect if the command message received as serial data from the engine control module is valid The "rolling count check" value is created by adding an appended hexadecimal calculation to the pump duty cycle command value. In order to achieve a desired fuel pressure, a hexadecimal equivalent value representing the necessary fuel pump current pulse "On" time (duty cycle as a percent value) is transmitted to the FPPM. The corresponding "check" value is transmitted as well. At the FPPM, the received duty cycle command value is used to create an expected "rolling count" value using the same calculation method as the ECM. The expected "rolling count" value calculated at the receiving power module (smart device) is compared to the transmitted "rolling count" value. Transfer Case Speed Sensor Output (TCSS)	P2161	The diagnostic monitor detects an unrealistic drop in the TCSS signal due to a sudden electrical fault, wiring fault or sensor fault. The TCSS signal is rationalized against operating conditions of the vehicle. The rate of misfire over an interval is compared to both emissions and catalyst damaging thresholds. The pattern of crankshaft acceleration after the misfire is checked to differentiate between real misfire and other sources of crank shaft noise.	Crankshaft Deceleration Value(s) vs. Engine Speed and Engine load The equation used to calculate deceleration value is tailored to specific vehicle operating conditions. The selection of the equation used is based on the 1st single cylinder continuous misfire threshold tables encountered that are not max of range. Warm Up Catalyst Efficiency Below Threshold Bank 1	P0421	The Catalyst (CC DOC) monitor only runs during DPF regeneration and compares the CC DOC released oxidation heat and the post-injected fuel quantity both evaluated inside a determined portion of the DPF regeneration itself. Mass Air Flow (MAF) Sensor Performance	P0101	This monitor checks if the MAF sensor measure is coherent with MAF estimation when the HP EGR and LP EGR (if present) are closed. It is able to detect MAF sensor wiring harness poor contacts, MAF sensor internal fault (offset), leaks from the induction air circuit, leaks from the recirculation exhuast gas circuit. For OBDII market, it is used to detect a PCV disconnection. The standard test can be calibrated to run when engine conditions are recognised as IDLE, OVERRUN or HIGH LOAD. An intrusive test can be enabled, to force the HP EGR to close when particular conditions are encountered, to allow the monitoring to run in idle.	Drift high check: drift of the mass air flow Drift low check: drift of the mass air flow The drift of the mass air flow is calculated as the ratio between the MAF sensor reading and the estimated mass air flow. The ratio is averaged over a calibrate-able cumulative transient time. Cylinder 1 Injection Timing Perfomance - Over Retarded	P01CB	This diagnosis is able to detect an excessive negative drift on fuel injection quantity and timing affecting injector 1. During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the angular acceleration produced during the combustion phase. By comparing the angular acceleration value produced during the combustion phase with the angular acceleration that would be produced during the combustion of a nominal fuel quantity (e.g. 1,5mm3), the SQA is able to calculate the drift, in term of energizing time, on injector 1. 		diagnostic test that is performed in two different steps: The first is the suspicious (SSQA) in which all the injectors are classified as suspicious or not suspicious. During this phase several injections are performed on all the injectors in order to calculate the drift, in term of energizing time, of each injector. The drift found is then used together with the drift found in the previous test to enter a calibrate-able map in which a confidence level between 0 and 100% is given to each injector. The confidence levels depends on the delta energizing time between two consecutive tests. An injector is considered suspicious if the confidence level is lower than a calibrate-able threshold. The suspicious phase can only report test pass for not suspicious injectors while the injectors that fail the suspicious are tested by means of VSQA (Validation Small

Cylinder 2 Injection Timing Perfomance - Over Advanced	P01CE	This diagnosis is able to detect an excessive positive drift on fuel injection quantity and timing affecting injector 2. During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the angular acceleration produced during the combustion phase. By comparing the angular acceleration value produced during the combustion phase with the angular acceleration that would be produced during the combustion of a nominal fuel quantity (e.g. 1,5mm3), the SQA is able to calculate the drift, in term of energizing time, on injector 2. Several injections, with different injection quantities, are performed in order to extrapolate the results and obtain the injector behaviour in the small quantity area. Injection Timing Control Circuit	P0216	This DTC detects an ECU internal fault, by comparing the cumulative injection pulse width provided by HWIO and the cumulative injection pulse width calculated by Application SW.
		A calibration is used to define the pulses that have to be taken into account to calculate the cumulative injection pulse width, both by HWIO and by application SW.
		Two different thresholds are defined for detecting the fault. The high threshold depends on the number of injection pulses active, i.e. the injection pulses driven and monitored.
			The cumulative injection pulse width (both HWIO and Application SW) is calculated by considering only the pulses to be monitored, defined in the calibration **P0216_ET_CumulEnbl**
			
			if (Cumulative injection pulse width read by HWIO > Cumulative injection pulse width calculated by Application SW)
			{
			|Cumulative injection pulse width read by HWIO - Cumulative injection pulse width calculated by Application SW|

Cylinder Balance 1 Maximum Authority Reached	P0263	The Cylinder Balancing (CB) strategy is able to get a cylinder by cylinder external torque equalization to improve engine smooth running (less engine speed roughness, more driving comfort).. The Cylinder Balancing uses as input of the closed loop the unbalancing signal and provide, as output, the fuel volume correction to apply on each cylinder. The target of the closed loop is to get zero unbalancing on all cylinders. The unbalancing signal cointains the torque formed during the combustion phase of each cylinder. This diagnosis is able to detect if Cylinder Balancing fuel volume correctionapplied on cylinder 1 reach the saturation (positive or negative) without achieve the target (zero unbalancing). When CB correction for cylinder 1 reach the saturation (positive or negative) the CB control system sets a Boolean flag to true in order to inform the Max	Cylinder Balancing Fuel Volume Correction on cylinder 1 saturated (positive or negative). Cylinder 1 Fuel Injector Offset Learning At Min Limit	P02CC	This diagnosis (Min Authority monitoring) performs a check on the absolute Energizing Time learnt by SQA (Small Quantity Adjustment). During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the torque produced during the combustion phase. Two different learning strategies are used: Target SQA (TSQA): This strategy is a closed loop between fuel quantity injected and torque produced during combustion phase. The fuel quantity injected is increased/decreased until the angular acceleration target is reached. The Delta Energizing Time needed to achieve the target is then stored in SQA Map. Extrapolated SQA (ESQA): With this strategy several injections with different injection quantities are performed and, for	Each time a new value is entered in SQA map the diagnosis checks if: - DeltaET learnt by (x) SQA on cylinder 1. The result of this test is then stored in a boolean NV array cointaing the status of Minimum authority test (TRUE=Saturated, FALSE= Not saturated) for all the rail pressure levels defined for SQA. Cylinder 4 Fuel Injector Offset Learning At Min Limit	P02D2	This diagnosis (Min Authority monitoring) performs a check on the absolute Energizing Time learnt by SQA (Small Quantity Adjustment). During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the torque produced during the combustion phase. Two different learning strategies are used: Target SQA (TSQA): This strategy is a closed loop between fuel quantity injected and torque produced during combustion phase. The fuel quantity injected is increased/decreased until the angular acceleration target is reached. The Delta Energizing Time needed to achieve the target is then stored in SQA Map. Extrapolated SQA (ESQA): With this strategy several injections with different injection quantities are performed and, for	Each time a new value is entered in SQA map the diagnosis checks if: - DeltaET learnt by (x) SQA on cylinder 4. The result of this test is then stored in a boolean NV array cointaing the status of Minimum authority test (TRUE=Saturated, FALSE= Not saturated) for all the rail pressure levels defined for SQA. The DTC for minimum authority reached is set if, at least one element of the array is equal to TRUE and is unset when all the elements of the array are equal to FALSE.	< **KaFADC_t_SQA_Min AdptDeltET[us]**	SQA Diagnosis enabled (x)SQA injection management enabled	1.00 FAD_SQA_InjMgntEnbld	Time required to perform a learning with (x) SQA. Cylinder 5 Injection Timing Perfomance - Over Retarded	P01D3	This diagnosis is able to detect an excessive negative drift on fuel injection quantity and timing affecting injector 5. During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the angular acceleration produced during the combustion phase. By comparing the angular acceleration value produced during the combustion phase with the angular acceleration that would be produced during the combustion of a nominal fuel quantity (e.g. 1,5mm3), the SQA is able to calculate the drift, in term of energizing time, on injector 5. Several injections, with different injection quantities, are performed in order to extrapolate the results and obtain the injector behaviour in the small quantity area. This energizing time is then used for the	Suspicious confidence level of tested injector (To fail suspicious), function of Current Energizing time calculated with SSQA and delta Energizing time calculated in the previous test: **KtFADD_Pct_SSQA_InjSuspConfLvl** (Delta Enegizing Time, Delta Energizing Time old) In case the first test fails: Delta Energizing time calculated by VSQA (To fail Validation)	< 20.00 [%] > 1,000.00 [us]	SQA Diagnosis enabled SSQA and VSQA enabled Baro Pressure Ambient temp No Low Fuel level tank indication AND Boolean Flag used to enable low fuel level check is TRUE (x)SQA injection management enabled	1.00 1.00 >= 0.00 [kPa] >= 0.00 [°C] LowFuelConditionDiagnostic 0.00 FAD_XSQA_LrnCondEnbl	Inj_To_PassFail_SSQA Number of injections in case sospicious pass or (if sospicious fails) Inj_To_PassFail_SSQA +Inj_To_PassFail_VSQA number of injections to pass or fail validation Once per Trip if suspicious and validations (in case of sospicious injectors detected) have been already completed in the previous driving cycle, otherwise the diagnosis starts from the interrupted status. During this phase several injections are performed on all the injectors in order to calculate the drift, in term of energizing time, of each injector. The drift found is then used together with the drift found in the previous test to enter a calibrate-able map in which a confidence level between 0 and 100% is given to each injector. 		Quantity Adjustment) in order to validate or not the fault. The validation starts from the most suspicious injector (with lower confidence level) found during Suspicious phase and performs a calibrate-able number of injections, generally higher than the number of injection performed during suspicious, in order to find out a more accurate drift value for the tested injector. If the Delta Energizing time calculated during this phase is higher than a calibrate-able threshold a DTC is set.

Cylinder 8 Injection Timing Perfomance - Over Advanced	P01DA	This diagnosis is able to detect an excessive positive drift on fuel injection quantity and timing affecting injector 8. During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the angular acceleration produced during the combustion phase. By comparing the angular acceleration value produced during the combustion phase with the angular acceleration that would be produced during the combustion of a nominal fuel quantity (e.g. 1,5mm3), the SQA is able to calculate the drift, in term of energizing time, on injector 8. Several injections, with different injection quantities, are performed in order to extrapolate the results and obtain the injector behaviour in the small quantity area. This energizing time is then used for the	Suspicious confidence level of tested injector (To fail suspicious), function of Current Energizing time calculated with SSQA and delta Energizing time calculated in the previous test: **KtFADD_Pct_SSQA_InjSuspConfLvl** (Delta Enegizing Time, Delta Energizing Time old) In case the first test fails: Delta Energizing time calculated by VSQA (To fail Validation)	< 20.00 [%] < -1,000.00 [us]	SQA Diagnosis enabled SSQA and VSQA enabled Baro Pressure Ambient temp No Low Fuel level tank indication AND Boolean Flag used to enable low fuel level check is TRUE (x)SQA injection management enabled	1.00 1.00 >= 0.00 [kPa] >= 0.00 [°C] LowFuelConditionDiagnostic 0.00 FAD_XSQA_LrnCondEnbl	Inj_To_PassFail_SSQA Number of injections in case sospicious pass or (if sospicious fails) Inj_To_PassFail_SSQA +Inj_To_PassFail_VSQA number of injections to pass or fail validation. 		diagnostic test that is performed in two different steps: The first is the suspicious (SSQA) in which all the injectors are classified as suspicious or not suspicious. During this phase several injections are performed on all the injectors in order to calculate the drift, in term of energizing time, of each injector. The drift found is then used together with the drift found in the previous test to enter a calibrate-able map in which a confidence level between 0 and 100% is given to each injector. The confidence levels depends on the delta energizing time between two consecutive tests. An injector is considered suspicious if the confidence level is lower than a calibrate-able threshold. The suspicious phase can only report test pass for not suspicious injectors while the injectors that fail the suspicious are tested by means of VSQA (Validation Small

Cylinder 5 Fuel Injector Offset Learning At Min Limit	P02D4	This diagnosis (Min Authority monitoring) performs a check on the absolute Energizing Time learnt by SQA (Small Quantity Adjustment). During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the torque produced during the combustion phase. Two different learning strategies are used: Target SQA (TSQA): This strategy is a closed loop between fuel quantity injected and torque produced during combustion phase. The fuel quantity injected is increased/decreased until the angular acceleration target is reached. The Delta Energizing Time needed to achieve the target is then stored in SQA Map. 		each quantity, a delta ET is calculated using the difference between the torque produced during the combustion phase and the torque that would be produced during the combustion of a nominal fuel quantity. The results are then extrapolated in order to find the behaviour in all small quantity area. Each time a new value is entered in SQA map, regardless the strategies used to perform the learning (TSQA, ESQA, …), the diagnosis checks if the DeltaET learned by SQA is higher than a calibrateable threshold. Cylinder 8 Fuel Injector Offset Learning At Min Limit	P02DA	This diagnosis (Min Authority monitoring) performs a check on the absolute Energizing Time learnt by SQA (Small Quantity Adjustment). During Diesel Fuel Cut-off conditions SQA command the injection of a known quantity on one injector (e.g. 1,5mm^3) and checks, by means of crank-wheel sensor, the torque produced during the combustion phase. Two different learning strategies are used: Target SQA (TSQA): This strategy is a closed loop between fuel quantity injected and torque produced during combustion phase. The fuel quantity injected is increased/decreased until the angular acceleration target is reached. The Delta Energizing Time needed to achieve the target is then stored in SQA Map. Extrapolated SQA (ESQA): With this strategy several injections with different injection quantities are performed and, for	Each time a new value is entered in SQA map the diagnosis checks if: - DeltaET learnt by (x) SQA on cylinder 4. NOx Sensor Offset Learning At Min Limit - Bank 1 Sensor 1	P11D3	This diagnosis verifies if Upstream NOx sensor raw signal is affected by an offset	Check if NOx1 signal has an offset by learning the raw value in stable conditions during fuel cut off maneuver. A fault is detected if one of the following conditions is true: 1. Mean of all NOx sensor readings (where every reading is the mean value of a sampling window) OR 2. Mean of all NOx sensor readings (where every reading is the mean value of a sampling window)	< -90.00 ppm > 200.00 ppm	Combustion mode dependent enabling flag Engine is running Engine is not cranking Powertrain relay voltage NOx Sensor Bus relay is commanded ON Upstream NOx Sensor is present in the exhaust Sensor heater is in range: a) (Sensor heater raw resistance - sensor heater target resistance) / sensor heater target resistence b) condition a) is fulfilled for time Sensor supply in range Sensor dewpoint is reached Injection small quantity adjustment (SQA) learning is not active EGR measured position Exhaust mass flow is within a range DEF injection is within a range Engine speed is within a	**NOX_S1_OfstMntrEnblCmbMode** TRUE TRUE > 11.00 V TRUE TRUE < 0.03 % > - 0.03 % > 10.00 sec > 10.8V TRUE FAD_SQA_LrnET_Enbl ==FALSE < 100.00 % < 120.00 g/s > 0.00 g/s < 800.00 mg/s > -1.00 mg/s < 3,500.00 rpm	The monitor runs after fuel cut off maneuver, when air mass integral exceeds 100.00 g and Upstream NOx signal is stable for at least 0.00 s. The NOx value used for the monitor is calculated after sampling up to 3.00 sampling windows (each one made up of 5.00 samples), averaging the mean values of every window. Once computed this value, the diagnostic provides a result. Task=25ms	Type B, 2 Trips

NOx Sensor Performance - Sensing Element Bank 1 Sensor 2	P22FE	This diagnosis verifies the Downstream NOx sensor sensing cells integrity during afterrun	Check if there is any clogging in the Downstream NOx sensor measurement cavities that could result in reduced NOx-sensitivity. The sensor internal operating current set-points are changed such way, that the O2 concentration in 2nd sensor cavity is around 1000ppm. One test result is measured in fresh sensor state (at supplier plant) and stored in the sensor E2prom as diagnosis reference value. The diagnosis result is the ratio of current diagnosis value/reference value. The diagnosis result is processed with EWMA logic.	> 150 % OR < 50 %	No electrical failure on NOx2 sensor No out of range low failure on NOx2 sensor No out of range high failure on NOx2 sensor No failure on NOx2 CAN communication No electrical failure on NOx1 sensor No failure on O2 from NOx1 plausibility diagnostics No failure on SCR system No failure on downstream SCR HC model inputs No failure on crank sensor No failure on exhaust temperature sensor (downstream SCR) No failure on HC injector No failure on Vehicle Speed sensor	NOX_Snsr2_FltSt ==FALSE NOX_NOx2_OutOfRngLoFlt ==FALSE NOX_NOx2_OutOfRngHiFlt ==FALSE CAN_LostComm_FltN_BusB_NOxSnsr_B ==FALSE NOX_Snsr1_ElecFA ==FALSE OXY_NOx1_O2_Flt ==FALSE EXF_TotExhSCR_UpFlt ==FALSE SCR_HC_SCR_DwnFlt ==FALSE CrankSensor_FA ==FALSE EGT_TempSCR_DwnFlt ==FALSE HCI_GenericShtOffReq ==FALSE VehicleSpeedSensor_FA ==FALSE	Test per trip: 1 If Fast Initial Response EWMA is active then 1 test per trip are allowed If Fast Initial Response EWMA is active then 10 test per trip are allowed	Type B, 2 Trips

O2 Sensor Slow Response - Rich to Lean Bank 1 Sensor 1	P014C	This DTC checks if oxygen value dynamic is slower compared to a functioning sensor. Test is performed in transitions from high load to overrun. Once generic enabling conditions are met, diagnosis waits for engine operating point stability (in terms of engine speed and fuel injected). When a stable operating point is reached for a calibrated time and an overrun condition is detected, the delta between the actual O2 value (a) and the one in fresh air (b = 20.95 %) is calculated. O2S Slow Response Rich to Lean Bank 1 Sensor 2	P013A	This DTC checks if oxygen value dynamic is slower compared to a functioning sensor. Test is performed in transitions from high load to overrun. Once generic enabling conditions are met, diagnosis waits for engine operating point stability (in terms of engine speed and fuel injected). When a stable operating point is reached for a calibrated time and an overrun condition is detected, the delta between the actual O2 value (a) and the one in fresh air (b = 20.95 %) is calculated. Then two thresholds are calculated as percentage of the initial delta: O2_Thrsh1 = a + (b - a) * 0.00 O2_Thrsh2 = a + (b - a) * 0.00 Two timers are incremented to evaluate sensor dynamic while O2 moves from O2 initial value (a) to O2_Thrsh2	One of the following conditions shall be true: EWMA filtered O2 raising time from O2 initial value (a) to O2_Thrsh2 EWMA filtered O2 raising time from O2_Thrsh1 value to O2_Thrsh2	> 0.00 [s] > 0.00 [s]	**Global Enabling Condition** Engine running System voltage in range Sensor is fully operative (No SQA learning is active AND Boolean Flag used to enable SQA learning active status is TRUE) No Exhaust Brake active i.e. intake manifold pressure Enabled in combustion mode No pending or confirmed DTCs	> 11.00 [V] OXY_O2_NOx2_SDC_CrtdNotRlb == FALSE FAD_SQA_LrnET_Enbl == FALSE 0 [boolean] < 0.00 [kPa] refer to supporting table (**KaOXYD_b_NOx2_IncrDynChkCmbEnbl**) NOX_Snsr2_NotVld NOX_Snsr2_PresFlt OXY_NOx2SignRngChkFlt OXY_NOx2ChkFlt FHP_InjLeakageFA (MAF_MAF_SnsrFA AND MAF_MAF_SnsrTFTKO)	EWMA filtering: multiple tests per trip are allowed. SCR NOx Catalyst Efficiency Below Threshold Bank 1	P20EE	The diagnosis checks if there is a malfunction in the SCR NOx conversion system measuring its SCR NOx conversion efficiency. SCR NOx conversion efficiency is evaluated by two NOx sensors (upstream & downstream SCR). The monitoring is executed by comparing measured NOx conversion efficiency and expected NOx conversion efficiency: - Measured NOx conversion efficiency is calculated as η_Eff_Msrd = 1 - [∫ NOx_Dwn_Msrd / ∫ NOx_Up_Msrd] - Expected NOx conversion efficiency is evaluated as η_Eff_Ref = 1 - [∫ NOx_Dwn_Ref / ∫ NOx_Up_Msrd]	- If EWMA feature is not enabled (1 == 0 [Boolean]), measured SCR NOx conversion efficiency (η_Eff_Msrd) lower than expected one (η_Eff_Ref) - If EWMA feature is enabled (1 == 1 [Boolean]), EWMA filtering is applied to the difference between measured SCR NOx conversion efficiency (η_Eff_Msrd) and expected one (η_Eff_Ref)	- If EWMA filter is not enabled (1 == 0 [Boolean]) --> η_Eff_Ref - If EWMA filter is enabled (1 == 1 [Boolean]) --> Fail threshold is = 0, Repass threshold is = 0	Test enabled by calibration; No active DTCs; Debounce time elapsed after SCR chemical model is healed; Debounce time elapsed after exiting from transient dosing forced by remedial action (conditions active only if Market ≠ USA_CARB); Diagnostic system not disabled; Test not yet executed on current key cycle except the case where EWMA filtering is enabled and in Rapid Response (RR) or Fast Initial Response (FIR) state; Tests per trip up to calibratable value when EWMA filter is active and in Fast Initial Response (FIR) state;	CalOut = 1 [Boolean]; ≠ NOX_Snsr1_NOx_Flt ≠ NOX_NOx_SnsrSCR_DwnFlt ≠ EGT_TempSCR_UpFlt ≠ EGP_PresSCR_UpFlt ≠ EXM_TurbFlowNotValid ≠ SCR_RDP_Flt ≠ SCR_TipStuckFltSt ≠ SCR_ChemicalMdlFlt; Debounce = 300 [sec]; Debounce = 300 [sec]; NotDsbl = True [Boolean]; NotRun = True [Boolean]; FIR test trip < 2 ;	One failure to set the DTC. Air Control Active (Air Control Active)

Air control is active if NONE of the following conditions are verified:

1. Air control is shut off due to an air system fault: AIC_AirShtOffReq==TRUE
2. Engine is ready
3. Engine is cranking
4. Air system actuators (HP EGR, LP EGR, Throttle) are not available (control shut off)
5. Zero torque condition is active (for all combustion modes except for LNT DeNOx and LNT DeSOx Rich): TRUE if Desired torque < 2.00 [Nm]. When active, it is deactivated if Desired torque >= (2.00 + 2.00) [Nm].
6. Large injected fuel condition is active:
   FALSE for SCR service check, Fully Warm Emissions, DeSOx Rich, DeNOx, Strong and Soft Warm Up combustion modes.
   For other combustion modes, it is TRUE if Fuel request is higher than a high threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Fuel request drops below a low threshold.

   These thresholds depend on combustion modes specific calibrations, which are function of the engine speed:

   - DPF and HCS modes:
     - ☐ High: **AIC_AirCntrlShtOffActn: Fuel High Threshold for D1 and D3** [mm^3]
     - ☐ Low: **AIC_AirCntrlShtOffActn: Fuel Low Threshold for D1 and D3** [mm^3]
   - DPF Rich idle mode:
     - ☐ High: **AIC_AirCntrlShtOffActn: Fuel High Threshold for D4** [mm^3]
     - ☐ Low: **AIC_AirCntrlShtOffActn: Fuel Low Threshold for D4** [mm^3]
   - All other modes:
     - ☐ High: **AIC_AirCntrlShtOffActn:Fuel High Threshold for others** [mm^3]
     - ☐ Low: **AIC_AirCntrlShtOffActn: Fuel Low Threshold for others** [mm^3]

7. Engine Coolant Temperature too high condition is active:
   FALSE for SCR service check, DeSOx Rich, DeNOx combustion modes.
   For other combustion modes, it is TRUE if Engine Coolant Temperature is higher than a high threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Engine Coolant Temperature drops below a low threshold.

   These thresholds depend on specific calibrations, related to different combustion modes:

   - DPF and HCS modes:
     - ☐ High: 124.00 [°C]
     - ☐ Low: 120.00 [°C]
   - All other modes:

Air Control Active (Air Control Active)

- ☐ High: 124.00 [°C]
- ☐ Low: 120.00 [°C]

8. Engine Coolant Temperature too low condition is active:

If Engine coolant temperature is NOT higher than the global temperature threshold for OBDII market (OBD Coolant Enable Criteria==FALSE) AND

ECT_TooLow==TRUE:

This last condition is FALSE for SCR service check, DeSOx Rich, DeNOx combustion modes.

For other combustion modes, it is TRUE if Engine Coolant Temperature is lower than a low threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Engine Coolant Temperature goes above a high threshold.

These thresholds depend on specific calibrations, related to different combustion modes:

- o DPF and HCS modes (thresholds depending on the Outside Air Temperature):
  - ☐ High: **AIC_AirCntrlShtOffActn: ECT Too Low Hysteresis High Threshold for DPF** [°C]
  - ☐ Low: **AIC_AirCntrlShtOffActn: ECT Too Low Hysteresis Low Threshold for DPF** [°C]
- o All other modes (thresholds depending on the Outside Air Temperature):
  - ☐ High: **AIC_AirCntrlShtOffActn: ECT Too Low Hysteresis High Threshold for others** [°C]
  - ☐ Low: **AIC_AirCntrlShtOffActn: ECT Too Low Hysteresis Low Threshold for others** [°C]

9. Intake Air Temperature too high condition is active:

FALSE for DeSOx Rich, DeNOx combustion modes.

For other combustion modes, it is TRUE if Intake Air Temperature is higher than a high threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Intake Air Temperature drops below a low threshold.

These thresholds depend on specific calibrations, related to different combustion modes:

- o DPF and HCS modes:
  - ☐ High: 90.00 [°C]
  - ☐ Low: 80.00 [°C]
- o SCR service check mode:
  - ☐ High: 90.00 [°C]
  - ☐ Low: 80.00 [°C]
- o All other modes:
  - ☐ High: 90.00 [°C]
  - ☐ Low: 80.00 [°C]

Air Control Active (Air Control Active)

10. Intake Air Temperature too low condition is active:
FALSE for DeSOx Rich, DeNOx combustion modes.
For other combustion modes, it is TRUE if Intake Air Temperature is lower than a low threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Intake Air Temperature goes above a high threshold.

These thresholds depend on specific calibrations, related to different combustion modes:

- o DPF and HCS modes:
  - ☐ High: -50.00 [°C]
  - ☐ Low: -60.00 [°C]
- o SCR service check mode:
  - ☐ High: -50.00 [°C]
  - ☐ Low: -60.00 [°C]
- o All other modes:
  - ☐ High: -50.00 [°C]
  - ☐ Low: -60.00 [°C]

11. Outside Air Temperature too high condition is active:
FALSE for DeSOx Rich, DeNOx combustion modes.
For other combustion modes, it is TRUE if Intake Air Temperature is higher than a high threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Intake Air Temperature drops below a low threshold.

These thresholds depend on specific calibrations, related to different combustion modes:

- o DPF and HCS modes:
  - ☐ High: 80.00 [°C]
  - ☐ Low: 70.00 [°C]
- o All other modes:
  - ☐ High: 80.00 [°C]
  - ☐ Low: 70.00 [°C]

12. Outside Air Temperature too low condition is active:
FALSE for DeSOx Rich, DeNOx combustion modes.
For other combustion modes, it is TRUE if Intake Air Temperature is lower than a low threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Intake Air Temperature goes above a high threshold.
These thresholds depend on specific calibrations, related to different combustion modes:

- o DPF and HCS modes:
  - ☐ High: -40.00 [°C]

- ☐ Low: -43.00 [°C]

o All other modes:

- ☐ High: -20.00 [°C]
- ☐ Low: -23.00 [°C]

13. Ambient pressure too low condition is active:
FALSE for DPF and HCS, SCR service check, LNT (DeNOx, DeSOx Rich and DeSOx Lean), Fully Warm Emissions combustion modes.
For other combustion modes, it is TRUE if Ambient Pressure is lower than a low threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Ambient Pressure goes above a high threshold.

These thresholds depend on specific calibrations, related to different combustion modes:

o All other modes:

- ☐ High: 74.00 [kPa]
- ☐ Low: 72.00 [kPa]

14. EGR control set-point request is maximum: TRUE if Air setpoint == 1,200.00 [mg]

15. Overlong idle condition is active:
FALSE for DPF, SCR service check, LNT (DeNOx, DeSOx Rich and DeSOx Lean) combustion modes.
For other combustion modes, it is TRUE if Engine Speed is lower than a threshold and this condition lasts for a calibrate-able timer.

The threshold and the timer depend on specific calibrations, related to different combustion modes:

o All other modes:

- ☐ Threshold: 500.00 [rpm]
- ☐ Timer: 409.59 [s]

16. MAF drift intrusive test is requested:
TRUE if the MAF sensor rationality monitoring - intrusive airflow drift test is enabled (see the documentation related to P0101)

Conditions from 6 to 16 (14 excluded) are in AND with: Exhaust Gas Overtemperature NOT detected (EGT_ExhOverTemp==FALSE)

Conditions 7 and from 9 to 13 are also in AND with (EOBD market only): EGR intrusive test NOT enabled (Refer to "EGR intrusive test" Free

Boost Control in Closed Loop (Boost Control in Closed Loop)

Boost Control is in Closed Loop if NONE of the following conditions are verified:

1. Boost control is shut off due to a boost actuator fault: AIC_BstActrsDiagShtOff==TRUE
2. Engine is ready
3. Engine is cranking
4. Boost actuators (HCB, HTB, VGT, WG) are not available (control shut off):
   VGT Vacuum: VGT_PstnSnsrFA, VGT_PstnSnsrTFTKO, VGT_PstnCntrlFA, VGT_PstnCntrlTFTKO, VGT_ActCktFA, VGT_ActCktTFTKO
   VGT DC Motor: VGT_ActCktFA, VGT_ActCktTFTKO, VGT_PstnCntrlFA, VGT_PstnCntrlTFTKO, VGT_PstnSnsrCktFA, VGT_PstnSnsrCktTFTKO, VGT_PstnSnsrRatltyFlt
   WG: WGA_ActrDiagShtOff
   HCB: HCB_ActrDiagShtOff
   HTB: HTB_ActrDiagShtOff
5. Boost control is shut off due to a boost system fault: AIC_BstSysDiagShtOff==TRUE
6. Exhaust Brake functionality is active AND Exhaust Gas Overtemperature NOT detected (EGT_ExhOverTemp==FALSE)

Moreover, Boost Control is in Closed Loop if the following conditions are verified (in AND):

- Combustion mode is NOT SCR service check

- Fuel request (or Torque request, if the combustion mode is LNT DeSOx Rich or DeNOx) is higher than a “On” threshold, with hysteresis: if the condition is TRUE, then it remains TRUE until the Fuel request (or Torque request) drops below a “Off” threshold.)

  These thresholds depend on specific calibrations, related to different combustion modes, which are function of the engine speed:
  - o Fully Warm Emissions:
    - ☐ On: **AIC_BstCntrlCL: Fuel Request On Threshold for C2** [mm^3]
    - ☐ Off: **AIC_BstCntrlCL: Fuel Request On Threshold for C2** - 7.00 [mm^3]

  - o V2:
    - ☐ On: **AIC_BstCntrlCL: On Threshold for V2** [cmp]
    - ☐ Off: **AIC_BstCntrlCL: On Threshold for V2** - 0.00 [cmp]
  - o V1:

Boost Control in Closed Loop (Boost Control in Closed Loop)

- ☐ On: **AIC_BstCntrlCL: On Threshold for V1** [cmp]
- ☐ Off: **AIC_BstCntrlCL: On Threshold for V1** - 0.00 [cmp]

o Default:

- ☐ On: **AIC_BstCntrlCL: Fuel Request On Threshold for others** [mm^3]
- ☐ Off: **AIC_BstCntrlCL: Fuel Request On Threshold for others** - 3.00 [mm^3]

Air Control Transition (Air Control Transition)

An air control transition is active when one of the following conditions occur:
- Desired EGR rate transition from 0 % to greater than 0 %
- LP EGR (if present) control transition from closed loop on air flow to closed loop on LP EGR flow, or vice-versa: Refer to "Other AICR DSL flags" Free Form
- HP EGR control transition from closed loop on air flow to closed loop on HP EGR flow, or vice-versa: Refer to "Other AICR DSL flags" Free Form

An air control transition check is enabled when:
- Previous air control transition has ended
- Air control transition is active

After air control transition check enabling, air control transition is recognised as ENDED after a time >= **AirCntrlTrnstnEnd: Timer threshold** [s]

Other AICR DSL flags (Other AICR DSL flags)

%%%%% Throttle control active %%%%%
Throttle control is active if (conditions in AND):
- Air Control is Active (Refer to "Air Control Active" Free Form)
- A manifold pressure drop is requested

%%%%% Manifold pressure drop request %%%%%
A Manifold pressure drop is NOT requested if air control is working only in EGR control (Desired EGR rate is 100%) and a transition is over.
A transition starts if previous Desired EGR rate <100% and ends when Throttle valve position > 50.00 [%]

%%%%% HP EGR control %%%%%
HP EGR control is in closed loop on air flow if (conditions in AND):
- A manifold pressure drop is not requested
- Desired LPE split is 0%

Otherwise, HP EGR control is in closed loop on HP EGR flow

%%%%% LP EGR control %%%%%
LP EGR control is in closed loop on air flow if (conditions in AND):
- Throttle control is active
- Desired LPE split is 100%

Otherwise, LP EGR control is in closed loop on LP EGR flow

EGR Intrusive test (EGR Intrusive test)

EGR flow intrusive test has the target to activate the air control and the air flow deviation monitoring (P0401 or P0402) in particular environmental conditions where usually the EGR rate control is always switched off.
When the intrusive test is enabled, a dedicated flow setpoint value is provided to air control.

EGR flow intrusive test is enabled when the following criteria are satisfied:

- Test enabled by calibration: 0.00 ==TRUE

- Combustion mode is Normal

- EGR flow deviation monitoring (P0401 or P0402) not yet performed in current driving cycle

- Difficult launch NOT detected

- The EGR is shut off due to the condition of air setpoint equal to maximum setpoint. Air setpoint == 1,200.00 [mg] (this condition is no more evaluated since the intrusive test is enabled for the first sample: when enabled, the intrusive test is requesting the EGR to be active)

- Vehicle speed < 0.50 [kph]

- Fuel request < 0.00 [mm^3]

- Engine Coolant Temperature > 60.00 [°C]

- Engine speed in range (> 720.00 AND < 1,150.00 [rpm]) for a time >= 2.50 [s]

- Ambient Air Pressure in range (> 75.00 AND < 85.00 [kPa])

- Outside Air Temperature in range (> -10.00 AND < 35.00 [°C])

- No faults active: ECT_Sensor_FA, AIC_OAT_SignalFA, VehicleSpeedSensor_FA, AAP_AmbientAirPresDfltd

OBD Coolant Enable Criteria (OBD Coolant Enable Criteria)

OBD Coolant enable
Starting in 11.15A software GM has created a coordinated signal within the ECM that serves as a master enable for diagnostics/controls that use coolant as an enable condition. Controls and diagnostics may choose to enable prior to this calculated signal, but calibrating beyond the OBD limit will not function because of this signal. This enable condition is also put on the CAN bus for other modules to consume as well.

KeTHMG_b_elecstatequipd = 0 for this application

For mechanical thermostat applications (KeTHMG_b_elecstatequipd = 0)
OBD Coolant Enable Temp = P0128 Primary target temp – Calibratable offset (0-32) – 1
OBD Coolant Enable Temp = 65 - 0.0 – 1
OBD Coolant Enable Temp = 64.0

For E-stat applications (KeTHMG_b_elecstatequipd = 1)

OBD Coolant Enable Temp = Max(Min(ECT Control Temp) – Primary Warm up delta, Min primary P0128 target) – Calibratable offset (0-32) – 1
OBD Coolant Enable Temp = Max(Min(KaTHMC_T_TMS_EngCoolReq) - KaECTR_T_CTR_WrmUpDeltaTemp[0], KaECTR_T_CTR_WrmUpTargetMin[0]) - KeECTR_T_CTR_GlblMinOffst – 1
OBD Coolant Enable Temp = Max(90.5 - 19 , 65) - 0.0 – 1
OBD Coolant Enable Temp = 70.5

OBD Max Coolant Achieved (OBD Max Coolant Achieved)

OBD Max Coolant Achieved

Starting in 18.18 software GM has created a coordinated signal within the ECM that serves as a master indication that the overtemperature "hot" light is active. This coordination forces controls and diagnostics to be active up until this signal is true. Controls and diagnostics may choose to disable at a higher temperature than this signal, but calibrating to a lower temperature will not work because of this signal.

This signal is also broadcast on the CAN buss for other modules to consume as well.
An indication of "True" means that the overtemperature "hot" light is active

IF
Engine Coolant Temperature > 124.0 ºC OR Engine Metal Temperature (if equipped) > 150.0 ºC
AND
Engine runtime ≥ 0.0 seconds

Set OBD Max Coolant Achieved = TRUE

MEM FNA Matched Flag (MEM FNA Matched Flag)

MEMR FNA Matched Flag

GM software maintains a flag that indicates when an ECU has been programmed. When the controller is powered on, the logic compares the application software and calibration data file part numbers and design level suffixes (DLS) that are programmed into ECU flash memory to the part number and DLS data stored in ECU non-volatile memory. If any difference in the part number or DLS values are found, the MEMR_FNA_Matched flag is set to FALSE, otherwise the flag is set to TRUE.

Run/Crank Active (Run/Crank Active)

Run/Crank Active conditiions

Run/Crank Active is governed by a hysteresis pair of voltages.
Run/Crank Active = True when the run/crank ignition voltage > 6.0 volts.
Run/Crank Active = False when the run/crank ignition voltage drops < 2.0 volts.

Battery Voltage In Range (Battery Voltage In Range)

Battery Voltage In Range conditions

Depending on available inputs, the best battery voltage analog input Is chosen via calibration.
Supported options include:
- Standard Battery Voltage
- Ignition Run/Crank
- Battery Input 1
- Battery Input 2
- Higher of Battery Input 1 and Battery Input 2
- Serial data

If BatteryPresent = False then Battery voltage = standard battery voltage
Else if Run/Crank Active = TRUE then Battery voltage = run/crank ignition voltage
Else Battery voltage = Serial data battery voltage
Battery Voltage In Range = True when Battery Voltage > 11.0 volts

Control Flags Tab

1) DPF_CCB_Crtn is the soot correction calculated by Configurable Correction Block (CCB) model.
CCB is enabled if:
- DPF_EnblDPF = 0
- NOx mass flow upstream the DPF is above 0.00 (With Hysteresis 0.00)
- Inner DPF Temperature estimated through temperature sensors or a thermal model is inside the range identified by 200.00 - 210.00 and 440.00 - 450.00 .
- The percentage valued of ranked soot model is above the product between **DPF_CCB_SootThrsh** and **DPF_SootThrshCrtn.**

2) The Resistive flow calculation is disabled**, DPF_ResistFlowCalcOff** = 1, if one of those conditions is fulfilled for calibratable debouncing time 0.00 [sec]:
- DPF Differential pressure sensor reading is below 0.00 [KPa]
- Estimated exhaust gas volume flow rate is below 30.00 [l/s]
- DPF_FR_CalcDsbl and 0.00 are both = 1

. Derivative of pressure drop across the DPF is above 1,000.00 [KPa/sec]
- DPF_LastRgnAvg is below -1.00
- Fuel Request is outside the range identified by **DPF_ResistFlowDsblLo** and **DPF_ResistFlowDsblHi**
- The regeneration is on going and with the DPF upstream tempearture greater than **DPF_EffRgnHysHi** (with hysteresys **DPF_EffRgnHysLo**)

3) DPF_ResistFlowFltd
It is the Filtered exhaust gas resistive flow, that indicates the amount of soot present inside in the DPF.
The flow resistance depends on Pressure difference measured by exhaust pressure sensor(EGP) , between upstream and downstream DPF, and Exhaust Flow.
The Filtered Flow Resistance is filtered by a low pass filter with a calibratable time constant in order to obtain the mean value for diagnostic purposes**.**

4) EGT_Avg
Reference Temperature, **EGT_Avg**, at system start up is definited as:
The reference temperature at system start-up is an average calculation done using all temperature sensors present in the system. The usage of each temperature in the average calculation shall be decided via calibration (one for each sensor) and only if the sensor is no faulty.
The reference temperature shall be calculated only if all the following conditions are fulfilled:
- System supplied but engine still not running (also crack phase excluded). If after the crank phase the engine is not running but it is turned back to key on state the calculation shall be disable for a calibratable time
- Time from the last engine shutdown greater than a calibratable threshold(28,800.00)
- At least four sensor are available for the reference temperature calculation
- If after the crank phase the engine is not running but it is turned back to key on state the calculation shall be disable until the engine will run

The reference temperature shall be calculated as following:
T_AvrKeyOn= $((\sum T\_i) - T\_Max - T\_Min) / (n-2)$

where:
T_i : i-th system temperature
T_Max: Maximum temperature read
T_Min: Minimum temperature read
n: number of temperature sensors used for the reference temperature calculation

5) EGT_CatHtEnbl
VeEGTC_b_CatHtEnbl = 1 if:
- Combustion Mode equal to one of allowed modes (DPF, HCS, SCR Service Bay Test) OR with <KeEGTC_b_CatHtCombModeEnbl>
- Fuel Request inside calibratable range: FueRequested < **EGT_FuelReqMaxThreshold** and FuelRequested > **EGT_FuelReqMinThrsh** with hysteresis)
- Catalyst Up Temperature Sensor (EGT1) < 800.00 [°C] AND with Catalyst Up Control PID > 0 [mm3]
- No Fault on Catalyst Up Temperature Sensor: EGT_SnsrCatUpFlt
- One of two actuators (After Injection - Air Mass/Boost Pressure) available: After injection actuation enabled if 0.00 = 1 and no injection system fault is present (FUL_GenericInjSysFlt). Air Mass/Boost Pressure actuation enabled if 0.00 = 1 and either air control (AIC_AirCntrlShtOffAction) is not disabled by fault or boost control (AIC_BstCntrlCL) is not disabled.

6) EGT_DsblCL
VeEGTC_e_DsblCL == CeEGTC_e_AllCondEnblCL (CLC Enabled) if:
- Combustion Mode equal to one of allowed modes (DPF, DeSOx Lean)
- Post Injection is enabled (FUL_PostEnbl)
- Post Injection shall be currently released or Post Release Check shall be disabled (0.00)
- If Post Release Check is enabled (0.00) , Post Injection shall be enabled (FUL_PostEnbl) and it shall be currently released or not released for less than a calibratable debouncing time (0.00) while post injection open loop plus previous closed loop quantity are not below a minimum quantity -1.00 .
- Fuel Request above calibratable range : Fuel Requested > **EGT_FuelReqHysHiThrsh_DPF** with hysteresis **EGT_FuelReqHysLoThrsh_DPF**
- Catalyst Down Temperature Sensor < 700.00 [°C] AND with Post Injection Control PID > 0 [mm3]

Initial Supporting table - IdleSCD_Decel

Description: Used for P0300-P0308. Crankshaft decel threshold while in SCD mode. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load. Note: Misfire's Load term is %, but not PID$04. PID $04 is not robust to temperature and alitiitude shifts. (especially decel and jerk thresholds since they track actual air trapped in cylinder)

Initial Supporting table - Ring Filter

Description: Used for P0300-P0308. Driveline Ring Filter
After a low level misfire, another misfire may not be detectable until driveline ringing ceases. If no ringing seen, stop filter early.

Value Units: Number of Engine cycles after isolated misfire (Engine cycles)
X Unit: thousands of RPM   (rpm/1000)

Initial Supporting table - SCD_Decel

Description: Used for P0300-P0308 Crankshaft decel threshold. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load.

Value Units: Delta time per cylinder (usec)
X Unit: RPM
Y Units: percent load of max indicated torque (%)

Unique Supporting table - IdleSCD_Decel

Description: Used for P0300-P0308. Crankshaft decel threshold while in SCD mode. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load. Note: Misfire's Load term is %, but not PID$04. PID $04 is not robust to temperature and alititude shifts. (especially decel and jerk thresholds since they track actual air trapped in cylinder)

Value Units: Delta time per cylinder (usec)
X Unit: RPM
Y Units: percent load of max indicated torque (%)

Unique Supporting table - Number of Normals

Description: Used for P0300-P0308. Number of Normals for the Driveline Ring Filter
After a low level misfire, another misfire may not be detectable until driveline ringing ceases. If no ringing seen, stop filter early.

Value Units: Number of Engine cycles after isolated misfire (Engine cycles)
X Unit: thousands of RPM (rpm/1000)

Unique Supporting table - Pair_SCD_Decel

Description: Used for P0300 - P0308, Mulitplier to SCD_Decel to account for different pattern of Paired cylinder misfire. Multipliers are a function of engine rpm and % engine Load.

Value Units: multiplier
X Unit: RPM
Y Units: percent load of max indicated torque (%)

Unique Supporting table - SCD_Jerk

Description: Used for P0300-P0308. Crankshaft jerk threshold. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load.

Value Units: Change in Delta time per cylinder from last cylinder (usec)
X Unit: RPM
Y Units: percent load of max indicated torque (%)
